OrganizerWiki – Bryton Wilson

App for aiding development of a fantasy language.

Project Description

This website is a tool for creators. The idea is to have it lightweight, but versatile, as it gives the user the ability to combine use of text and images on each page. Each user will have an initial page with default categories to start organizing their work, and an index of all pages they have made so far. They can link each page to other pages, whether new or already made, essentially functioning as a personal project wiki.

Basic Layout:

- Starting page just has editable categories (5 by default)

    - pages index (perhaps a fixed category, or separate)

- Each connected page has 3 things:

- ➢ **text body**
- ➢ **relevant images**
- ➢ **related pages (list of links)**

Team

One or two additional people may be a benefit for this project.

Implementation

We plan to implement the MVP using an SQL, then migrate to NoSQL.

SQL

Not yet restricted to a pre-determined relational database.

No-SQL

I have knowledge with AWS, but it is not restricted to this option.

BOLTS

Business

If this were to be economized, I would suggest something along these lines:

- Non-eyesore advertisements along the side
- Or users can watch a commercial video at the beginning when they log in, allowing unencroached use for the next couple hours or so.

Operation

The founders will operate the app. Once it is successful it might be sold to bigger companies.

Legal

The business will be either a Utah LLC or Arizona LLC… (open to suggestions)

Technical

Priorities:

1. Choose an initial SQL database for a prototype
2. Choose programming languages for server and client sides.
3. Implement the MVP (after flushing out more thorough plans of app)

Social

This will have its own pool of demand. Initial referencing to it will be through websites that make recommendations for such tools, such as blogs and reddits.
